

This fit-up for Country Energy was undertaken to lessen the incidence of soot on the ladders, a safety issue that has been overcome with the addition of a **FuelMate** Catalyst, Combined with Fuel Savings in excess of 10% has given Management the incentive to investigate the benefits.

The Maintenance on these ladders was such that they had to be regularly washed to overcome the carbon soot from interfering with their work safety. The carbon does eventually impregnate the fibreglass ladders over 12-18months. An additional cost of \$3000.00 per ladder saved on top of the Fuel savings etc.
